Common Questions:

Q. Why does weight matter?

A. The weight of a shingle is based on the weight per 100 square feet of covered area. Shingles vary based on the thickness of the layer of asphalt applied to the base mat of the shingle. Generally, the heavier the shingle the longer they will last. Shingle weights range from about 200 lbs per one-hundred square feet up to 370 lbs per one-hundred square feet.

Q. What is UL 2218 Impact Resistance and what does the Class 4 Impact Rating Mean?

A. UL 2218 is UL's toughest impact test for shingles. In the roofing industry, the goal is to simulate durability against hail storms. A Class 4 rating is the highest rating a shingle can receive. Some insurance companies offer discounts for Class 4 rated roofs. "Standard" shingles may have ruptures and cracks visible after hail impacts.

Q. What is a Class A Fire Rated Shingle

A. Class A Fire Rating is the highest rating, offering the highest resistance to fire. Unrated is the worst, for example, many wood shakes roofs are unrated.

Q. What is SureStart Period all about?

A. Although problems rarely occur, CertainTeed wants you to have peace of mind so they offer the SureStart Protection during the critical early years of your roof. This protection covers 100% of the cost of shingles to repair or replace defective shingles. It also covers the cost of labor to repair or replace defective shingles. This coverage is transferable from the original owner to the first
